

Seven years of cooperation

In the beginning of 2017 a cooperation started between Ship Machine – Building JSCo and the Italian company Posidonia in the manufacture of ship anchors.

Following the exchange of documentation and quotations first a pilot order was placed which was executed by Ship Machine – Building JSCo with very high quality, and after the subsequent visit and audit by the Italian client the long term cooperation started.

The size of the anchors varies widely – from thirty kilograms to more than two tons. A specific feature of this production is that all anchor elements go through machining – mainly on lathes and machining centers.

The thicknesses of the steel plates grade S355J2+N range between 12 and 180mm, and depending on the thickness the plates are processed by either plasma or oxy-fuel cutting on a CNC machine. Anchors have been produced also out of stainless steel.

And so in the course of this successful cooperation Ship Machine – Building JSCo has manufactured more than 1800 anchors (up to mid 2023) and Ship Machine – Building trust that there are good prospects this common work to continue and expand in the future.
